

## How to save \$\$ with your ink jet printer.

You know the story line: You finally found that perfect all-in-one ink-jet printer, it has every feature you want and a few extras, and at an unbelievable great price so you buy it. Once it is home, the set-up is easy, no problems with the software, it works great! Then you find out that the ink cartridges are not full capacity cartridges. They actually only contain a few drops of ink. So you head back to the store only to find that a set of full capacity ink cartridges are half the price of the printer! Then a few weeks down the road, you get a printhead clog, so you “clean the printhead” which is not unlike pouring your expensive ink down the crapper. If you are like me, I tend to snarl every time I walk past my printer.

Then I found [WWW.inkproducts.com](http://WWW.inkproducts.com) - they sell CIS, or Continuous Ink Supply systems. The CIS for my Epson Work Force printer cost \$112, which was almost exactly the cost of a set of Epson ink carts. After a year of use I have yet to run out of any color, and when you do run low - you can purchase ink by the quart at a great price. So check them out, and email me if you have any questions.
